
ELEN E4810: Digital Signal Processing

Topic 3: Fourier domain

1. The Fourier domain
2. Discrete-Time Fourier Transform (DTFT)
3. Discrete Fourier Transform (DFT)
4. Convolution with the DFT

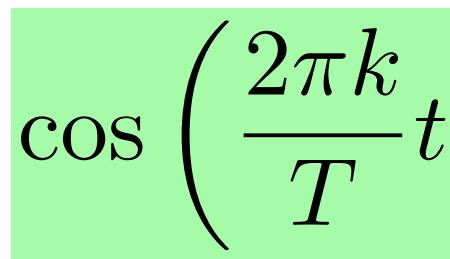

1. The Fourier Transform

- Basic observation (continuous time):
A **periodic** signal can be decomposed into sinusoids at **integer multiples** of the **fundamental frequency**

- i.e. if $\tilde{x}(t) = \tilde{x}(t + T)$
we can approach \tilde{x} with

$$\tilde{x}(t) \approx \sum_{k=0}^M a_k \cos \left(\frac{2\pi k}{T} t + \phi_k \right)$$

*Harmonics
of the
fundamental*

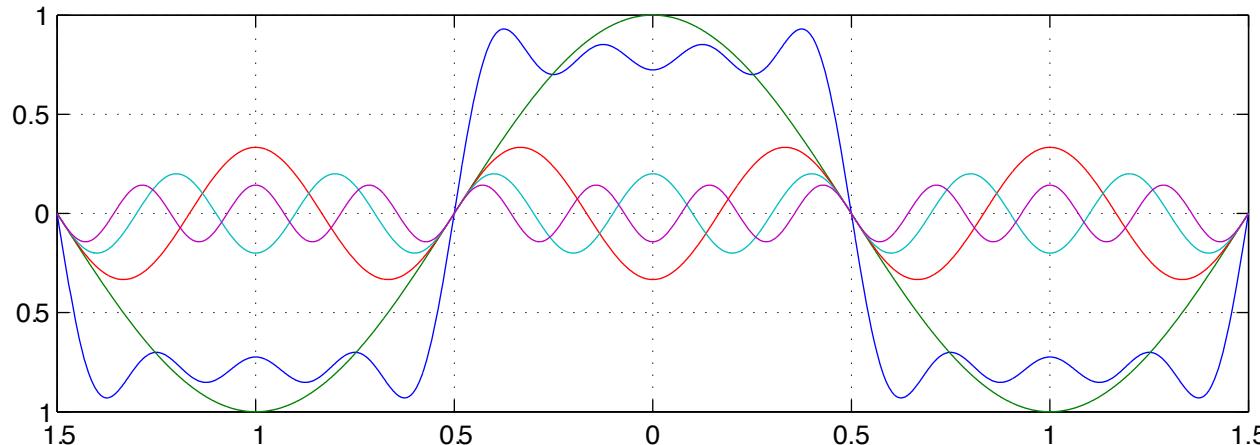

Fourier Series

$$\sum_{k=0}^M a_k \cos\left(\frac{2\pi k}{T}t + \phi_k\right)$$

- For a square wave,

$$\phi_k = 0; \quad a_k = \begin{cases} (-1)^{\frac{k-1}{2}} \frac{1}{k} & k = 1, 3, 5, \dots \\ 0 & \text{otherwise} \end{cases}$$

i.e. $x(t) = \cos\left(\frac{2\pi}{T}t\right) - \frac{1}{3} \cos\left(\frac{2\pi}{T}3t\right) + \frac{1}{5} \cos\left(\frac{2\pi}{T}5t\right) - \dots$

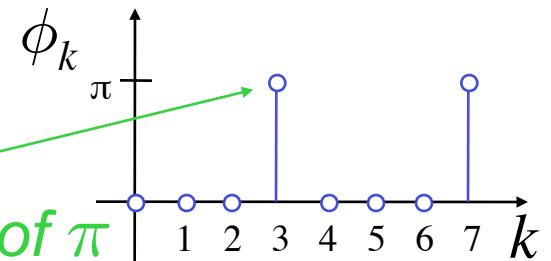

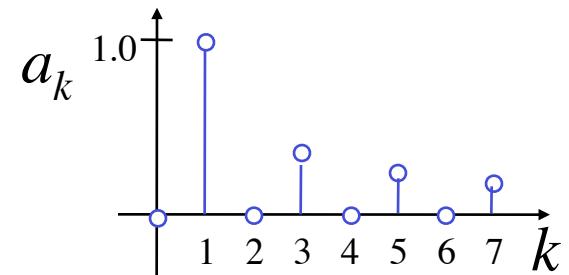

Fourier Domain

- x is equivalently described by its Fourier Series parameters:

$$a_k = (-1)^{\frac{k-1}{2}} \frac{1}{k} \quad k = 1, 3, 5, \dots$$

Negative a_k is equivalent to phase of π

- Complex form: $\tilde{x}(t) \approx \sum_{k=-M}^M c_k e^{j \frac{2\pi k}{T} t}$

Fourier Analysis

$$\tilde{x}(t) \approx \sum_{k=-M}^M c_k e^{j \frac{2\pi k}{T} t}$$

- How to find $\{|c_k|\}$, $\{\arg\{c_k\}\}$?
Inner product with
(conjugate) complex sinusoids:

$$c_k = \frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{-j \frac{2\pi k}{T} t} dt$$

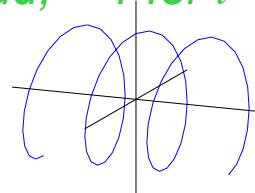

Fourier Analysis

$$\tilde{x}(t) \approx \sum_{k=-M}^M c_k e^{j \frac{2\pi k}{T} t}$$

$$\begin{aligned}\hat{c}_k &= \frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{-j \frac{2\pi k}{T} t} dt \quad ; \text{ call } \tau = \frac{2\pi}{T} t \\ &= \frac{1}{2\pi} \int_{-\pi}^{\pi} x\left(\frac{T}{2\pi}\tau\right) e^{-jk\tau} d\tau \\ &= \frac{1}{2\pi} \int_{-\pi}^{\pi} \left(\sum_l c_l e^{jl\tau} \right) e^{-jk\tau} d\tau \\ &= \sum_l c_l \left(\frac{1}{2\pi} \int_{-\pi}^{\pi} e^{j(l-k)\tau} d\tau \right) \\ &= c_k\end{aligned}$$

*Integral of (l-k) complete cycles of a complex sinusoid;
= 0 for l ≠ k ∵ real (cos) part is complete cycles, imag (sin) part is odd; = 1 for l = k ∵ ∫ 1 dτ*

Fourier Series Analysis

■ Thus, $c_k = \frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{-j \frac{2\pi k}{T} t} dt$

because complex sinusoids $e^{-j \frac{2\pi k}{T} t}$
pick out the corresponding sinusoidal
components linearly combined in

$$x(t) = \sum_{k=-M}^M c_k e^{j \frac{2\pi k}{T} t}$$

Fourier Transform

- Fourier **series** for periodic signals extends naturally to **Fourier Transform** for **any** (CT) signal (not just periodic):

$$X(j\Omega) = \int_{-\infty}^{\infty} x(t)e^{-j\Omega t} dt$$

*Fourier
Transform (FT)*

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\Omega)e^{j\Omega t} d\Omega$$

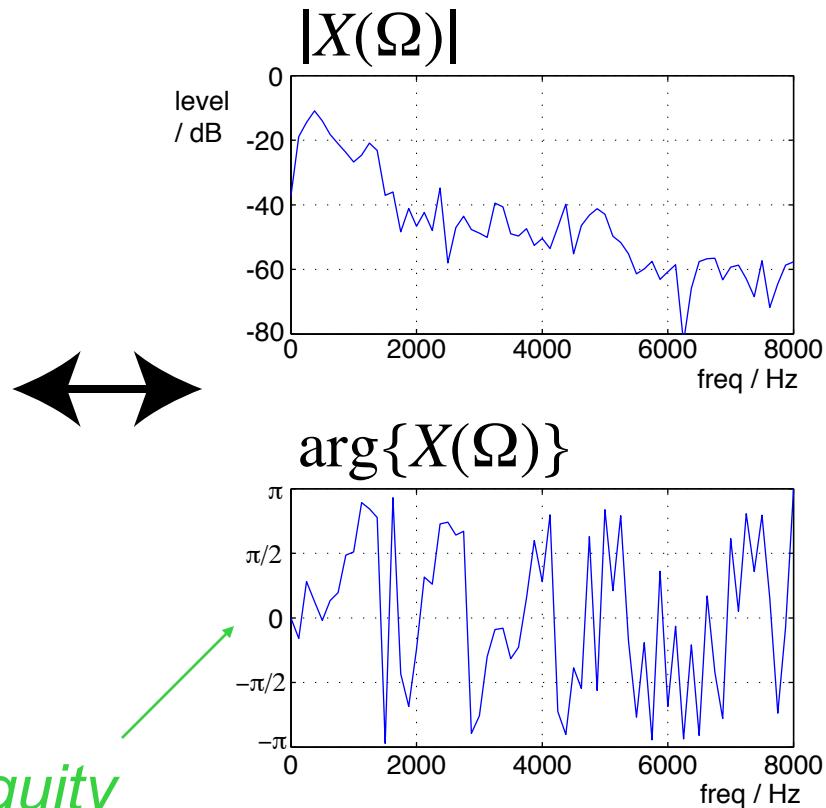

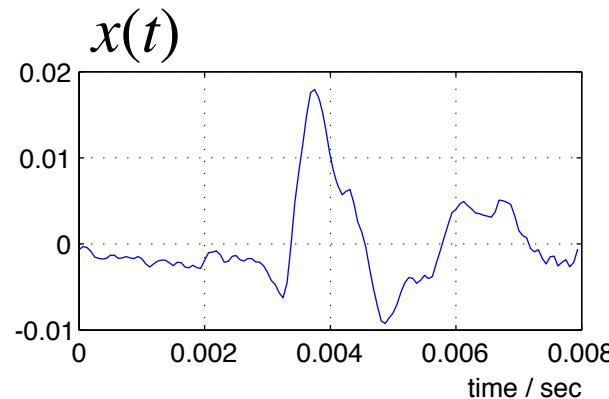

*Inverse Fourier
Transform (IFT)*

- Discrete index k → continuous freq. Ω

Fourier Transform

- Mapping between two continuous functions:

2π ambiguity

Fourier Transform of a sine

- Assume $x(t) = e^{j\Omega_0 t}$

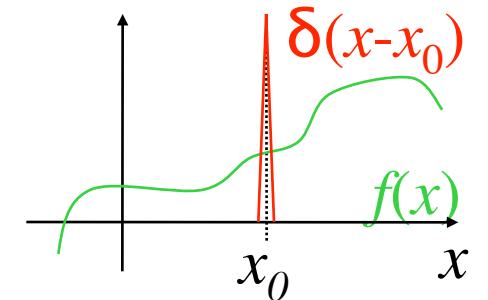

Now, since $x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\Omega) e^{j\Omega t} d\Omega$

...we know $X(\Omega) = 2\pi\delta(\Omega - \Omega_0)$

...where $\delta(x)$ is the **Dirac delta function**

(continuous time) i.e.

$$\int \delta(x - x_0) f(x) dx = f(x_0)$$

- $\rightarrow x(t) = A e^{j\Omega_0 t} \leftrightarrow X(\Omega) = A \delta(\Omega - \Omega_0)$

Fourier Transforms

	<i>Time</i>	<i>Frequency</i>
Fourier Series (FS)	Continuous periodic $\tilde{x}(t)$	Discrete infinite c_k
Fourier Transform (FT)	Continuous infinite $x(t)$	Continuous infinite $X(\Omega)$
Discrete-Time FT (DTFT)	Discrete infinite $x[n]$	Continuous periodic $X(e^{j\omega})$
Discrete FT (DFT)	Discrete finite/pdc $\tilde{x}[n]$	Discrete finite/pdc $X[k]$

2. Discrete Time FT (DTFT)

- FT defined for discrete sequences:

$$X(e^{j\omega}) = \sum_{n=-\infty}^{\infty} x[n]e^{-j\omega n} \quad DTFT$$

- Summation (not integral)
- Discrete (normalized) frequency variable ω
- Argument is $e^{j\omega}$, not $j\omega$

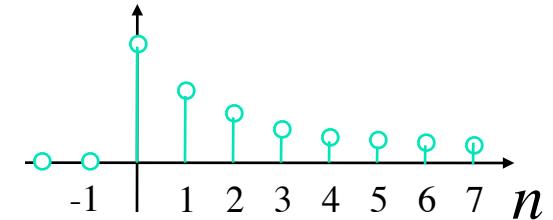

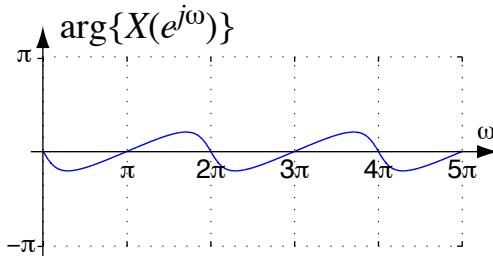

DTFT example

- e.g. $x[n] = \alpha^n \cdot \mu[n]$, $|\alpha| < 1$

$$\Rightarrow X(e^{j\omega}) = \sum_{n=-\infty}^{\infty} \alpha^n \mu[n] e^{-j\omega n}$$

$$= \sum_{n=0}^{\infty} (\alpha e^{-j\omega})^n$$

$$= \frac{1}{1 - \alpha e^{-j\omega}}$$

$$S = \sum_{n=0}^{\infty} c^n \Rightarrow cS = \sum_{n=1}^{\infty} c^n$$

$$\Rightarrow S - cS = c^0 = 1$$

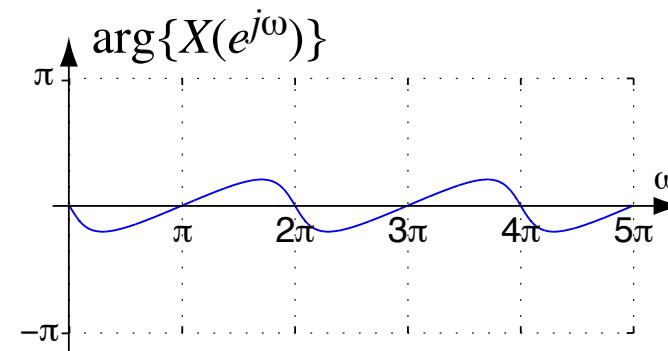

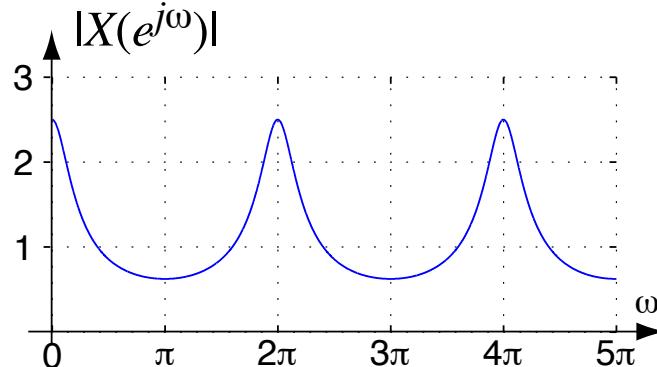

$$\Rightarrow S = \frac{1}{1 - c} \quad (|c| < 1)$$

Periodicity of $X(e^{j\omega})$

- $X(e^{j\omega})$ has periodicity 2π in ω :

$$\begin{aligned} X(e^{j(\omega+2\pi)}) &= \sum x[n] e^{-j(\omega+2\pi)n} \\ &= \sum x[n] e^{-j\omega n} e^{-j2\pi n} = X(e^{j\omega}) \end{aligned}$$

- Phase ambiguity of $e^{j\omega}$ makes it implicit

Inverse DTFT (IDTFT)

- Same basic “Fourier Synthesis” form:

$$x[n] = \frac{1}{2\pi} \int_{-\pi}^{\pi} X(e^{j\omega}) e^{j\omega n} d\omega \quad IDTFT$$

- Note: continuous, periodic $X(e^{j\omega})$
discrete, infinite $x[n]$...
- IDTFT is actually Fourier **Series analysis**
(except for sign of ω)

IDTFT

- Verify by substituting in DTFT:

$$x[n] = \frac{1}{2\pi} \int_{-\pi}^{\pi} X(e^{j\omega}) e^{j\omega n} d\omega$$

$$= \frac{1}{2\pi} \int_{-\pi}^{\pi} \left(\sum_l x[l] e^{-j\omega l} \right) e^{j\omega n} d\omega$$

$$= \sum_l x[l] \frac{1}{2\pi} \int_{-\pi}^{\pi} e^{j\omega(n-l)} d\omega$$

= 0 unless
 $n = l$
i.e. = $\delta[n-l]$

$$= \sum_l x[l] \text{sinc} \pi(n-l) = x[n]$$

sinc

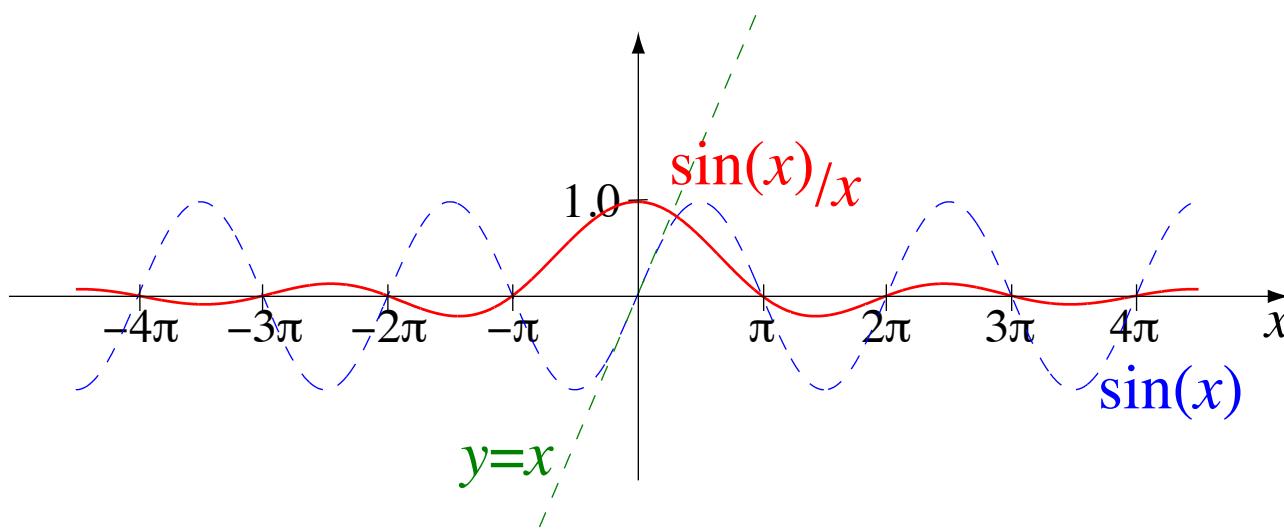

$$\begin{aligned} \frac{1}{2\pi} \int_{-\pi}^{\pi} e^{j\omega(n-l)} dw &= \frac{1}{2\pi} \left[\frac{e^{j\omega(n-l)}}{j(n-l)} \right]_{-\pi}^{\pi} \\ &= \frac{1}{2\pi} \left(\frac{e^{j\pi(n-l)} - e^{-j\pi(n-l)}}{j(n-l)} \right) \\ &= \frac{1}{2\pi} \left(\frac{2j \sin \pi(n-l)}{j(n-l)} \right) = \text{sinc } \pi(n-l) \end{aligned}$$

- Same as $\int \cos \because \text{imag } j \sin$ part cancels

sinc

- $\text{sinc } x \Delta \frac{\sin x}{x}$

- $= 1$ when $x = 0$
- $= 0$ when $x = r \cdot \pi, r \neq 0, r = \pm 1, \pm 2, \pm 3, \dots$

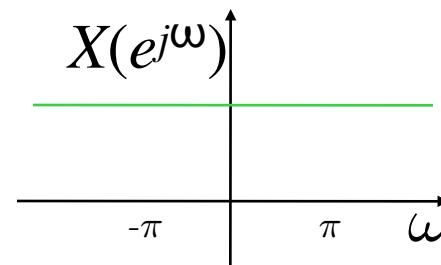

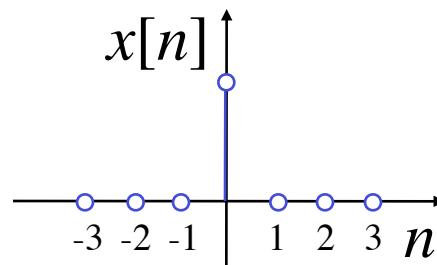

DTFTs of simple sequences

- $\underline{x[n] = \delta[n]} \Rightarrow X(e^{j\omega}) = \sum_{n=-\infty}^{\infty} x[n]e^{-j\omega n}$
 $= e^{-j\omega 0} = 1 \quad (\text{for all } \omega)$

- i.e.

$$\begin{array}{ccc} x[n] & & X(e^{j\omega}) \\ \hline & & \\ \delta[n] & \leftrightarrow & 1 \end{array}$$

DTFTs of simple sequences

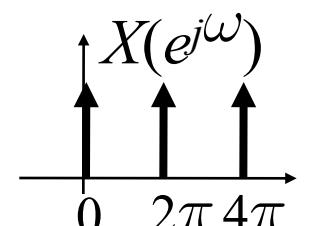

- $x[n] = e^{j\omega_0 n}$: $x[n] = \frac{1}{2\pi} \int_{-\pi}^{\pi} X(e^{j\omega}) e^{j\omega n} d\omega$ *IDTFT*
 $\Rightarrow X(e^{j\omega}) = 2\pi \cdot \delta(\omega - \omega_0)$ over $-\pi < \omega < \pi$

but $X(e^{j\omega})$ must be **periodic** in $\omega \Rightarrow$

$$e^{j\omega_0 n} \Leftrightarrow \sum_k 2\pi \cdot \delta(\omega - \omega_0 - 2\pi k)$$

- If $\omega_0 = 0$ then $x[n] = 1 \forall n$

so $1 \Leftrightarrow \sum_k 2\pi \cdot \delta(\omega - 2\pi k)$

DTFTs of simple sequences

- From before:

$$\alpha^n \mu[n] \leftrightarrow \frac{1}{1 - \alpha e^{-j\omega}} \quad (|\alpha| < 1)$$

- $\mu[n]$ tricky - not finite

$$\mu[n] \leftrightarrow \frac{1}{1 - e^{-j\omega}} + \sum_k \pi \delta(\omega + 2\pi k)$$

DTFT of 1/2

DTFT properties

- Linear:

$$\alpha g[n] + \beta h[n] \leftrightarrow \alpha G(e^{j\omega}) + \beta H(e^{j\omega})$$

- Time shift:

$$g[n - n_0] \leftrightarrow e^{-j\omega n_0} G(e^{j\omega})$$

- Frequency shift:

$$e^{j\omega_0 n} g[n] \leftrightarrow G\left(e^{j(\omega - \omega_0)}\right)$$

*'delay'
in
frequency'*

DTFT example

■ $x[n] = \delta[n] + \alpha^n \mu[n-1] \leftrightarrow ?$

$$= \delta[n] + \alpha(\alpha^{n-1} \mu[n-1])$$

$$\Rightarrow X(e^{j\omega}) = 1 + \alpha \left(e^{-j\omega \cdot 1} \cdot \frac{1}{1 - \alpha e^{-j\omega}} \right)$$

$$= 1 + \frac{\alpha e^{-j\omega}}{1 - \alpha e^{-j\omega}} = \frac{1 - \alpha e^{-j\omega} + \alpha e^{-j\omega}}{1 - \alpha e^{-j\omega}}$$

$$= \frac{1}{1 - \alpha e^{-j\omega}}$$

$$\Rightarrow x[n] = \alpha^n \mu[n]$$

DTFT symmetry

$$X(e^{j\omega}) = \sum_{n=-\infty}^{\infty} x[n]e^{-j\omega n}$$

- If $x[n] \leftrightarrow X(e^{j\omega})$ then...

$$x[-n] \leftrightarrow X(e^{-j\omega}) \quad \text{from summation}$$

$$x^*[n] \leftrightarrow X^*(e^{-j\omega}) \quad (e^{-j\omega})^* = e^{j\omega}$$

$$\text{Re}\{x[n]\} \leftrightarrow X_{CS}(e^{j\omega}) = \frac{1}{2} [X(e^{j\omega}) + X^*(e^{-j\omega})]$$

conjugate symmetry cancels Im parts on IDTFT

$$j\text{Im}\{x[n]\} \leftrightarrow X_{CA}(e^{j\omega}) = \frac{1}{2} [X(e^{j\omega}) - X^*(e^{-j\omega})]$$

$$x_{cs}[n] \leftrightarrow \text{Re}\{X(e^{j\omega})\}$$

$$x_{ca}[n] \leftrightarrow j\text{Im}\{X(e^{j\omega})\}$$

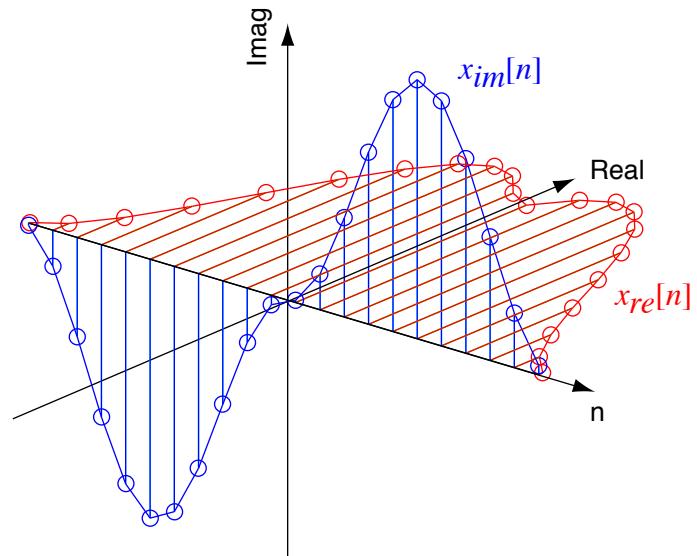

DTFT of real $x[n]$

- When $x[n]$ is pure real, $\Rightarrow \underline{X(e^{j\omega}) = X^*(e^{-j\omega})}_{X_{CS}}$

$$x_{cs}[n] \equiv x_{ev}[n] = x_{ev}[-n] \Leftrightarrow X_R(e^{j\omega}) = X_R(e^{-j\omega})$$

$$x_{ca}[n] \equiv x_{od}[n] = -x_{od}[-n] \Leftrightarrow X_I(e^{j\omega}) = -X_I(e^{-j\omega})$$

$x[n]$ real, even
 $\Leftrightarrow X(e^{j\omega})$ even, real

DTFT and convolution

- Convolution: $x[n] = g[n] \circledast h[n]$

$$\begin{aligned}\Rightarrow X(e^{j\omega}) &= \sum_{n=-\infty}^{\infty} (g[n] \circledast h[n]) e^{-j\omega n} \\ &= \sum_n \left(\sum_k g[k] h[n-k] \right) e^{-j\omega n} \\ &= \sum_k \left(g[k] e^{-j\omega k} \sum_n h[n-k] e^{-j\omega(n-k)} \right) \\ &= G(e^{j\omega}) \cdot H(e^{j\omega})\end{aligned}$$

$$g[n] \circledast h[n] \leftrightarrow G(e^{j\omega})H(e^{j\omega})$$

*Convolution
becomes
multiplication*

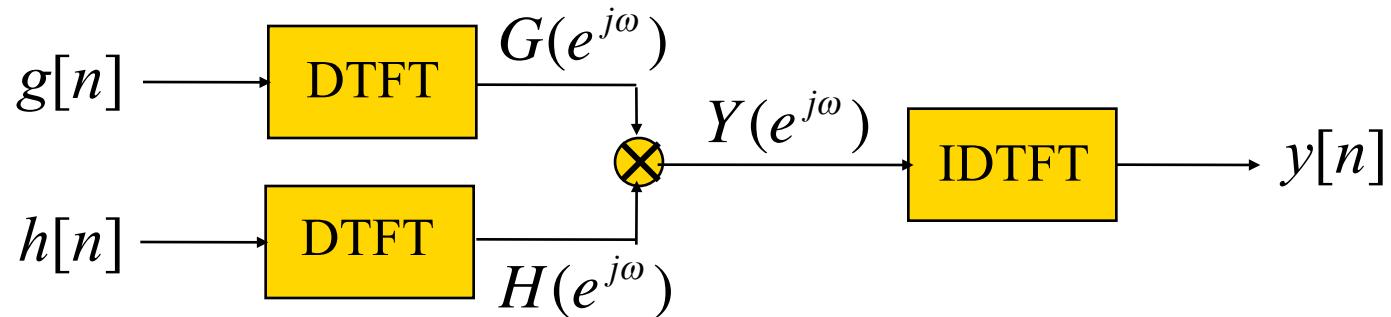

Convolution with DTFT

- Since $g[n] \circledast h[n] \leftrightarrow G(e^{j\omega})H(e^{j\omega})$

we can calculate a convolution by:

- finding DTFTs of $g, h \rightarrow G, H$
- multiply them: $G \cdot H$
- IDTFT of product is result, $g[n] \circledast h[n]$

DTFT convolution example

- $x[n] = \alpha^n \cdot \mu[n] \Rightarrow X(e^{j\omega}) = \frac{1}{1 - \alpha e^{-j\omega}}$
 - $h[n] = \delta[n] - \alpha \delta[n-1]$
 $\Rightarrow H(e^{j\omega}) = 1 - \alpha(e^{-j\omega \cdot 1}) \cdot 1$
 - $y[n] = x[n] \circledast h[n]$
 $\Rightarrow Y(e^{j\omega}) = H(e^{j\omega})X(e^{j\omega})$
 $= \frac{1}{1 - \alpha e^{-j\omega}} \cdot (1 - \alpha e^{-j\omega}) = 1$
- $\Rightarrow y[n] = \delta[n]$ i.e. ...

DTFT modulation

- Modulation: $x[n] = g[n] \cdot h[n]$
Could solve if $g[n]$ was just sinusoids...

$$X(e^{j\omega}) = \sum_{\forall n} \left(\frac{1}{2\pi} \int_{-\pi}^{\pi} G(e^{j\theta}) e^{j\theta n} d\theta \right) \cdot h[n] e^{-j\omega n}$$

write $g[n]$ as IDTFT

$$= \frac{1}{2\pi} \int_{-\pi}^{\pi} G(e^{j\theta}) \left[\sum_{\forall n} h[n] e^{-j(\omega-\theta)n} \right] d\theta$$

$$\Rightarrow g[n] \cdot h[n] \leftrightarrow \frac{1}{2\pi} \int_{-\pi}^{\pi} G(e^{j\theta}) H(e^{j(\omega-\theta)}) d\theta$$

Dual of convolution in time

Parseval's relation

- “Energy” in time and frequency domains are **equal**:

$$\sum_{\forall n} g[n]h^*[n] = \frac{1}{2\pi} \int_{-\pi}^{\pi} G(e^{j\omega})H^*(e^{j\omega})d\omega$$

- If $g = h$, then $g \cdot g^* = |g|^2 = \text{energy...}$

Energy density spectrum

- Energy of sequence $\varepsilon_g = \sum_{\forall n} |g[n]|^2$
- By Parseval $\varepsilon_g = \frac{1}{2\pi} \int_{-\pi}^{\pi} |G(e^{j\omega})|^2 d\omega$
- Define **Energy Density Spectrum (EDS)**

$$S_{gg}(e^{j\omega}) = |G(e^{j\omega})|^2$$

EDS and autocorrelation

- Autocorrelation of $g[n]$:

$$r_{gg}[\ell] = \sum_{n=-\infty}^{\infty} g[n]g[n - \ell] = g[n] \circledast g[-n]$$

$$\Rightarrow DTFT\{r_{gg}[\ell]\} = G(e^{j\omega})G(e^{-j\omega})$$

- If $g[n]$ is *real*, $G(e^{-j\omega}) = G^*(e^{j\omega})$, so
 $DTFT\{r_{gg}[\ell]\} = |G(e^{j\omega})|^2 = S_{gg}(e^{j\omega})$ *no phase info.*
- Mag-sq of spectrum is DTFT of autoco

3. Discrete FT (DFT)

Discrete FT (DFT)

Discrete finite/pdc $x[n]$

Discrete finite/pdc $X[k]$

- A *finite* or *periodic* sequence has only N unique values, $x[n]$ for $0 \leq n < N$
- Spectrum is completely defined by N distinct frequency samples
- Divide $0..2\pi$ into N equal steps,
$$\{\omega_k\} = \frac{2\pi k}{N}$$

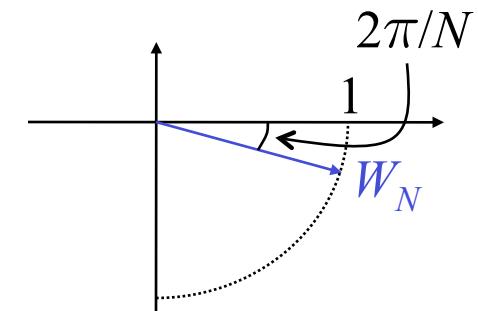

DFT and IDFT

- Uniform sampling of DTFT spectrum:

$$X[k] = X(e^{j\omega}) \Big|_{\omega=\frac{2\pi k}{N}} = \sum_{n=0}^{N-1} x[n] e^{-j\frac{2\pi k}{N} n}$$

- DFT:**
$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn}$$

where $W_N = e^{-j\frac{2\pi}{N}}$ i.e. -1/ N^{th} of a revolution

IDFT

- Inverse DFT:
- Check:

$$x[n] = \frac{1}{N} \sum_{k=0}^{N-1} X[k] W_N^{-nk}$$

$$x[n] = \frac{1}{N} \sum_k \left(\sum_l x[l] W_N^{kl} \right) W_N^{-nk}$$

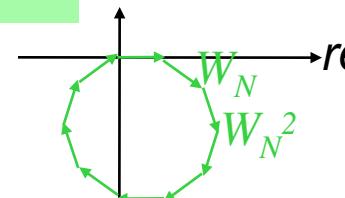

$$= \frac{1}{N} \sum_{l=0}^{N-1} x[l] \sum_{k=0}^{N-1} W_N^{k(l-n)}$$

$$= x[n]$$

*Sum of complete set
of rotated vectors
= 0 if $l \neq n$; = N if $l = n$*

im

*or finite
geometric series
 $= (1-W_N^{lN})/(1-W_N^l)$*

$0 \leq n < N$

DFT examples

- *Finite impulse* $x[n] = \begin{cases} 1 & n = 0 \\ 0 & n = 1 \dots N - 1 \end{cases}$

$$\Rightarrow X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn} = W_N^0 = 1 \quad \forall k$$

- *Periodic sinusoid:*

$$x[n] = \cos\left(\frac{2\pi rn}{N}\right) \quad (r \in \mathbb{Z}) \quad = \frac{1}{2} (W_N^{-rn} + W_N^{rn})$$

$$\Rightarrow X[k] = \frac{1}{2} \sum_{n=0}^{N-1} (W_N^{-rn} + W_N^{rn}) W_N^{kn}$$

$$(0 \leq k < N) \quad = \begin{cases} \frac{N}{2} & k = r, k = N - r \\ 0 & \text{otherwise} \end{cases}$$

DFT: Matrix form

- $X[k] = \sum_{n=0}^{N-1} x[n] \cdot W_N^{kn}$ as a matrix multiply:

$$\begin{bmatrix} X[0] \\ X[1] \\ X[2] \\ \vdots \\ X[N-1] \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & \cdots & 1 \\ 1 & W_N^1 & W_N^2 & \cdots & W_N^{(N-1)} \\ 1 & W_N^2 & W_N^4 & \cdots & W_N^{2(N-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & W_N^{(N-1)} & W_N^{2(N-1)} & \cdots & W_N^{(N-1)^2} \end{bmatrix} \begin{bmatrix} x[0] \\ x[1] \\ x[2] \\ \vdots \\ x[N-1] \end{bmatrix}$$

■ i.e.

$$\mathbf{X} = \mathbf{D}_N \cdot \mathbf{x}$$

Matrix IDFT

- If $\mathbf{X} = \mathbf{D}_N \cdot \mathbf{x}$
then $\mathbf{x} = \mathbf{D}_N^{-1} \cdot \mathbf{X}$
- i.e. inverse DFT is also just a matrix,

$$\mathbf{D}_N^{-1} = \frac{1}{N} \begin{bmatrix} 1 & 1 & 1 & \cdots & 1 \\ 1 & W_N^{-1} & W_N^{-2} & \cdots & W_N^{-(N-1)} \\ 1 & W_N^{-2} & W_N^{-4} & \cdots & W_N^{-2(N-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & W_N^{-(N-1)} & W_N^{-2(N-1)} & \cdots & W_N^{-(N-1)^2} \end{bmatrix}$$

$$= \frac{1}{N} \mathbf{D}_N^*$$

DFT and MATLAB

- MATLAB is concerned with *sequences* not continuous functions like $X(e^{j\omega})$
- Instead, we use the DFT to sample $X(e^{j\omega})$ on an (arbitrarily-fine) grid:
 - `X = freqz(x, 1, w);` samples the DTFT of sequence `x` at angular frequencies in `w`
 - `X = fft(x);` calculates the N -point DFT of an N -point sequence `x`

DFT and DTFT

$$\text{DTFT} \quad X(e^{j\omega}) = \sum_{n=-\infty}^{\infty} x[n] e^{-j\omega n}$$

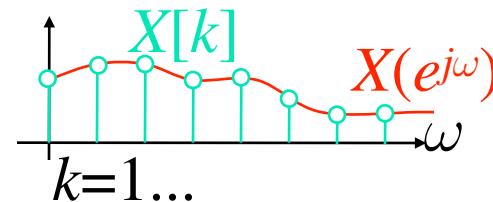

- *continuous freq* ω
- *infinite* $x[n]$, $-\infty < n < \infty$

$$\text{DFT} \quad X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn}$$

- *discrete freq* $k=N\omega/2\pi$
- *finite* $x[n]$, $0 \leq n < N$

- DFT ‘samples’ DTFT at discrete freqs:

$$X[k] = X(e^{j\omega}) \Big|_{\omega=\frac{2\pi k}{N}}$$

DTFT from DFT

- N -point DFT completely specifies the continuous DTFT of the finite sequence

$$\begin{aligned} X(e^{j\omega}) &= \sum_{n=0}^{N-1} \left(\frac{1}{N} \sum_{k=0}^{N-1} X[k] W_N^{-kn} \right) e^{-j\omega n} \\ &= \frac{1}{N} \sum_{k=0}^{N-1} X[k] \sum_{n=0}^{N-1} e^{-j\left(\omega - \frac{2\pi k}{N}\right)n} \end{aligned}$$

“periodic sinc”

$\Delta\omega_k = \omega - \frac{2\pi k}{N}$

interpolation

$$= \frac{1}{N} \sum_{k=0}^{N-1} X[k] \cdot \frac{\sin N \frac{\Delta\omega_k}{2}}{\sin \frac{\Delta\omega_k}{2}} \cdot e^{-j\frac{(N-1)}{2} \cdot \Delta\omega_k}$$

Periodic sinc

$$\begin{aligned} \sum_{n=0}^{N-1} e^{-j\Delta\omega_k n} &= \frac{1 - e^{-jN\Delta\omega_k}}{1 - e^{-j\Delta\omega_k}} \\ &= \frac{e^{-jN\Delta\omega_k/2}}{e^{-j\Delta\omega_k/2}} \cdot \frac{e^{jN\Delta\omega_k/2} - e^{-jN\Delta\omega_k/2}}{e^{j\Delta\omega_k/2} - e^{-j\Delta\omega_k/2}} \\ &= e^{-j\frac{(N-1)}{2} \cdot \Delta\omega_k} \frac{\sin N \frac{\Delta\omega_k}{2}}{\sin \frac{\Delta\omega_k}{2}} \end{aligned}$$

factor out half the angle

pure phase →

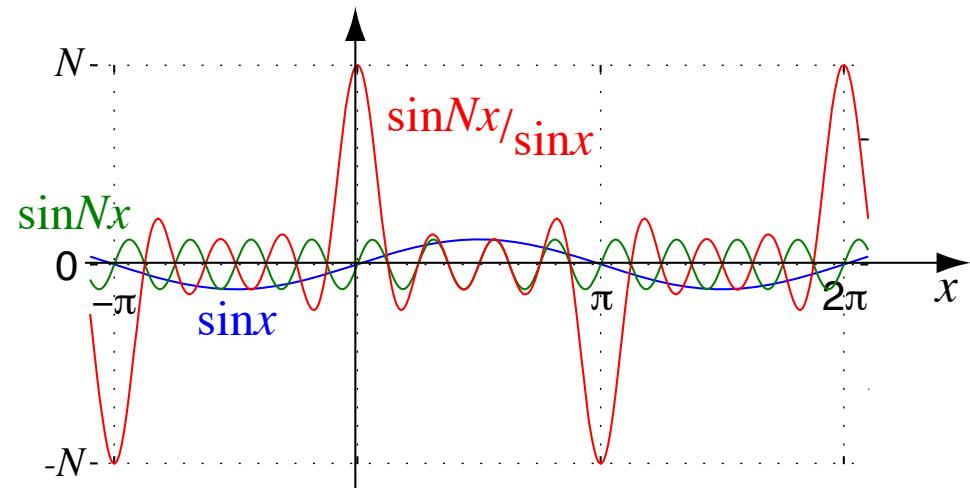

← *pure real*

- = N when $\Delta\omega_k = 0$; = $(-N)$ when $\Delta\omega_k/2 = \pi$
- = 0 when $\Delta\omega_k/2 = r \cdot \pi/N$, $r = \pm 1, \pm 2, \dots$
- other values in-between...

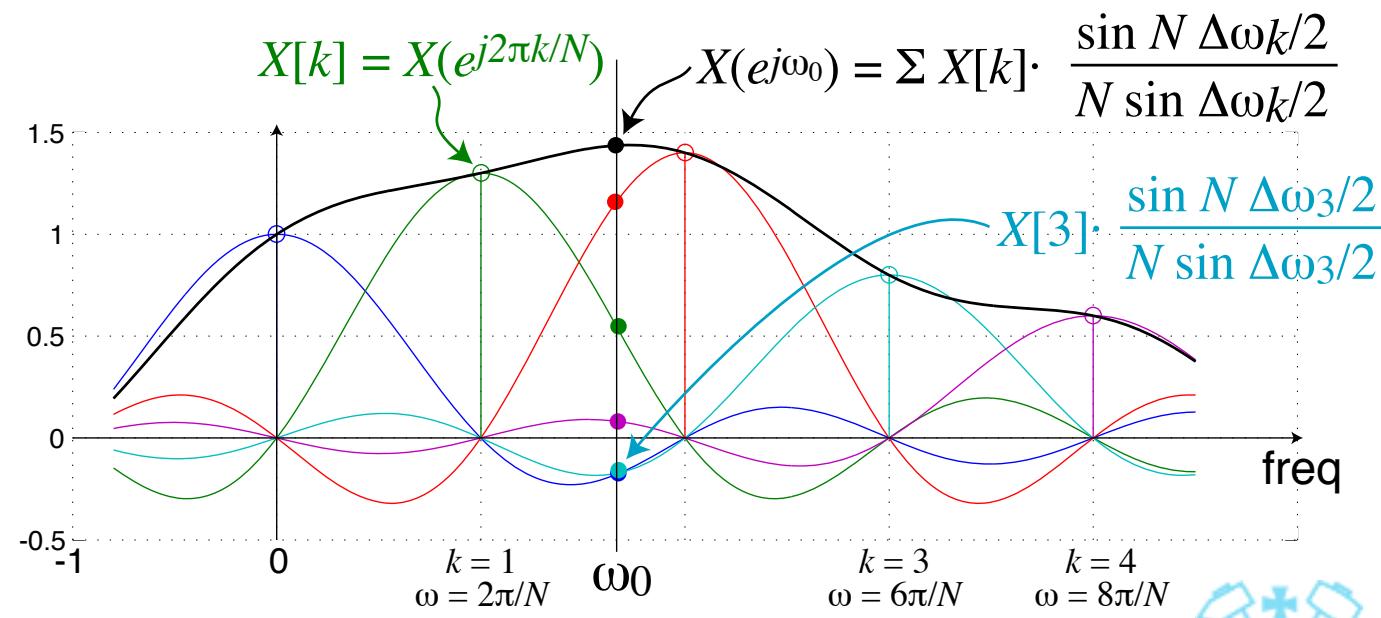

Periodic sinc

$$\frac{\sin Nx}{\sin x}$$

DFT \rightarrow DTFT
= interpolation
by periodic
sinc

$$X[k] \rightarrow X(e^{j\omega})$$

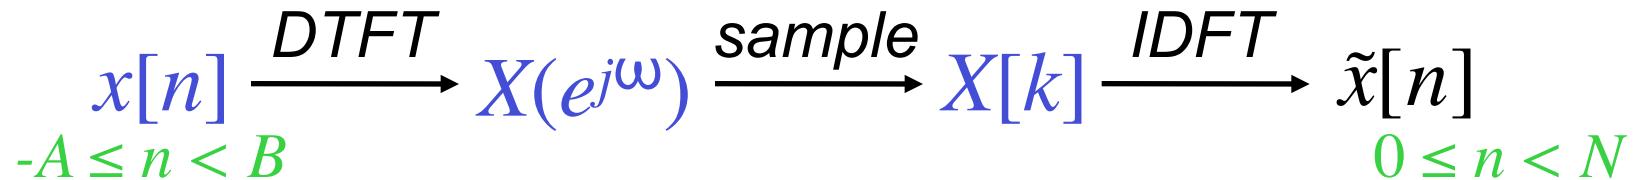

DFT from overlength DTFT

- If $x[n]$ has more than N points, can still form $X[k] = X(e^{j\omega}) \Big|_{\omega=\frac{2\pi k}{N}}$
- IDFT of $X[k]$ will give N point $\tilde{x}[n]$
- How does $\tilde{x}[n]$ relate to $x[n]$?

DFT from overlength DTFT

$$\tilde{x}[n] = \frac{1}{N} \sum_{k=0}^{N-1} \left(\sum_{\ell=-\infty}^{\infty} x[\ell] W_N^{k\ell} \right) W_N^{-nk}$$

= 1 for $n-\ell = rN$, $r \in \mathbb{I}$
 = 0 otherwise

$$= \sum_{\ell=-\infty}^{\infty} x[\ell] \left(\frac{1}{N} \sum_{k=0}^{N-1} W_N^{k(\ell-n)} \right)$$

$$\Rightarrow \tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n - rN] \quad \begin{array}{l} \text{all values shifted by} \\ \text{exact multiples of } N \text{ pts} \\ \text{to lie in } 0 \leq n \leq N \end{array}$$

DFT from DTFT example

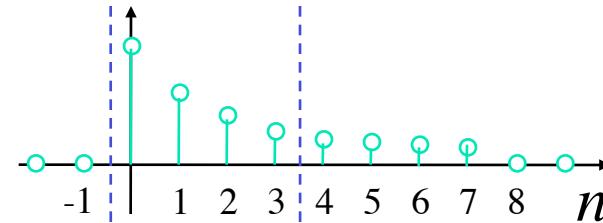

- If $x[n] = \{ 8, 5, 4, 3, 2, 2, 1, 1 \}$ (8 point)
- We form $X[k]$ for $k = 0, 1, 2, 3$ by sampling $X(e^{j\omega})$ at $\omega = 0, \pi/2, \pi, 3\pi/2$
- IDFT of $X[k]$ gives 4 pt $\tilde{x}[n] = \sum_{r=-\infty}^{\infty} x[n - rN]$
- Overlap only for $r = -1$: $(N = 4)$

$$\Rightarrow \tilde{x}[n] = \left\{ \begin{matrix} 8 & 5 & 4 & 3 \\ + & + & + & + \\ 2 & 2 & 2 & 1 \end{matrix} \right\} = \{10 \quad 7 \quad 5 \quad 4\}$$

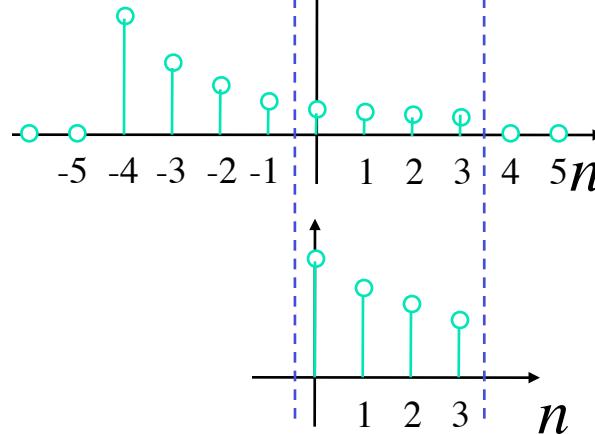

DFT from DTFT example

- $x[n]$

- $x[n+N]$
 $(r = -1)$

- $\tilde{x}[n]$

- $\tilde{x}[n]$ is the **time aliased** or ‘folded down’ version of $x[n]$.

Properties: Circular time shift

- DFT properties mirror DTFT, with twists:
- Time shift must stay within N -pt ‘window’

$$g[\langle n - n_0 \rangle_N] \leftrightarrow W_N^{kn_0} G[k]$$

- Modulo- N indexing keeps index between 0 and N -1:

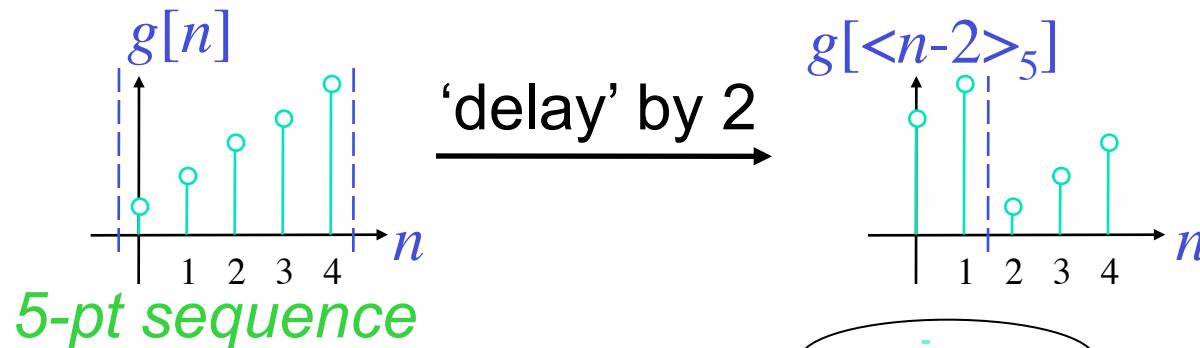

$$g[\langle n - n_0 \rangle_N] = \begin{cases} g[n - n_0] & n \geq n_0 \\ g[N + n - n_0] & n < n_0 \end{cases}$$

$0 \leq n_0 < N$

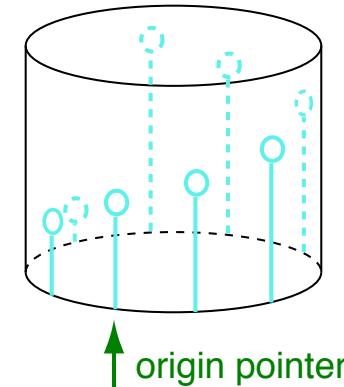

Circular time shift

- Points shifted out to the right don't disappear – they come in from the left

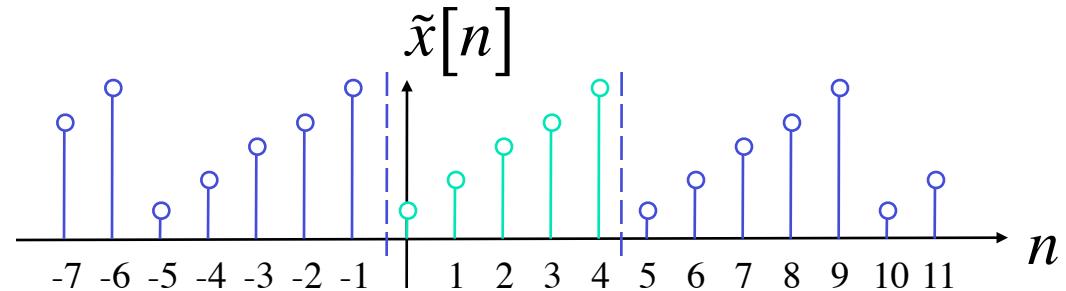

- Like a 'barrel shifter':

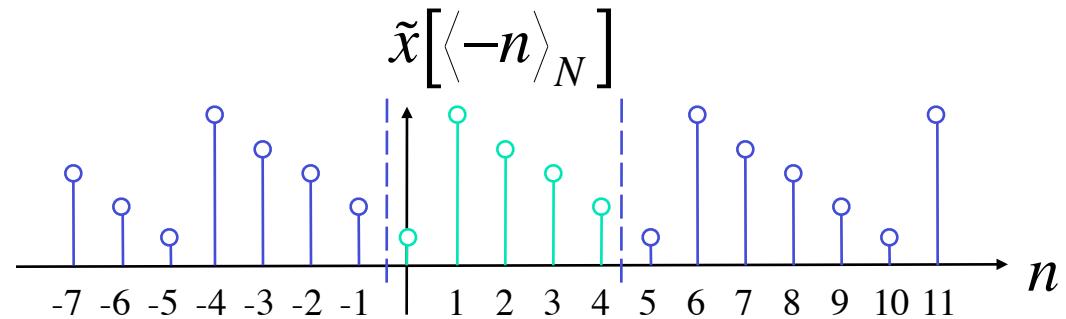

Circular time reversal

- Time reversal is tricky in ‘modulo- N ’ indexing - **not** reversing the sequence:

*5-pt sequence
made periodic*

*Time-reversed
periodic sequence*

- Zero point stays fixed; remainder flips

Duality

- DFT and IDFT are very similar
 - both map an N -pt vector to an N -pt vector
- Duality:

$$\text{if } g[n] \leftrightarrow G[k]$$

*Circular
time reversal*

$$\text{then } G[n] \leftrightarrow N \cdot g[\langle -k \rangle_N]$$

- i.e. if you treat DFT sequence as a **time** sequence, result is almost symmetric

4. Convolution with the DFT

- IDTFT of product of DTFTs of two N -pt sequences is their $2N-1$ pt convolution
- IDFT of the product of two N -pt DFTs can only give N points!
- Equivalent of $2N-1$ pt result time aliased:
 - i.e. $y_c[n] = \sum_{r=-\infty}^{\infty} y_l[n + rN]$ $(0 \leq n < N)$
 - must be, because $G[k]H[k]$ are exact samples of $G(e^{j\omega})H(e^{j\omega})$
- This is known as **circular convolution**

Circular convolution

- Can also do entire convolution with modulo- N indexing
- Hence, **Circular Convolution**:

$$\sum_{m=0}^{N-1} g[m]h[\langle n-m \rangle_N] \leftrightarrow G[k]H[k]$$

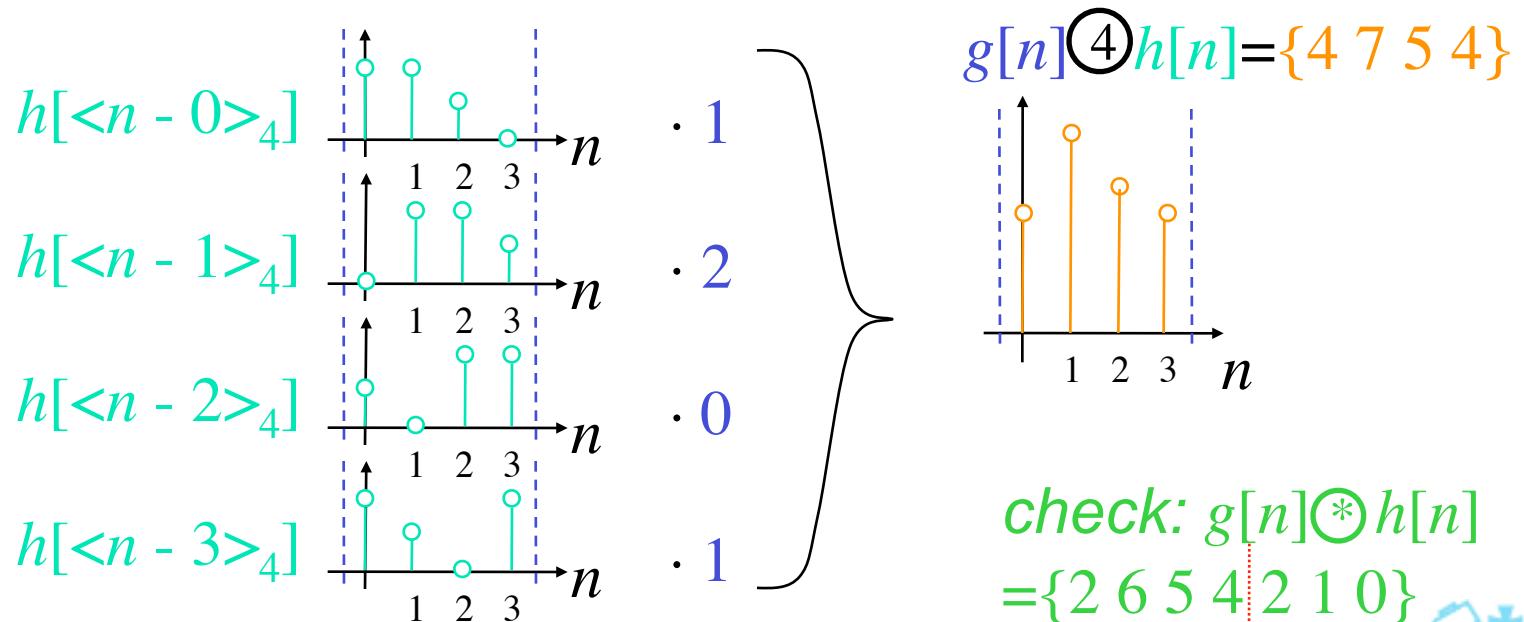

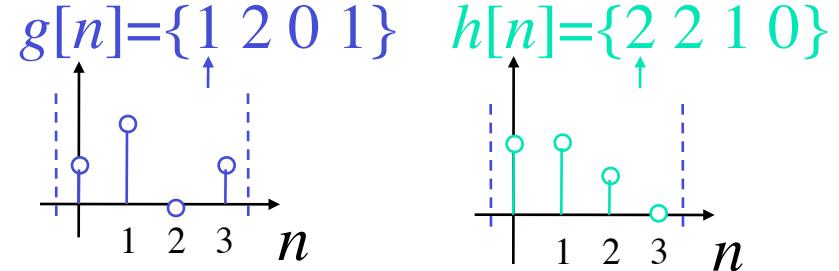

- Written as $g[n] \circledast_N h[n]$

Circular convolution example

- 4 pt sequences:

$$\sum_{m=0}^{N-1} g[m]h[\langle n-m \rangle_N]$$

check: $g[n] \odot h[n] = \{2, 6, 5, 4 | 2, 1, 0\}$

DFT properties summary

- Circular convolution

$$\sum_{m=0}^{N-1} g[m]h[\langle n-m \rangle_N] \leftrightarrow G[k]H[k]$$

- Modulation

$$g[n] \cdot h[n] \leftrightarrow \frac{1}{N} \sum_{m=0}^{N-1} G[m]H[\langle k-m \rangle_N]$$

- Duality

$$G[n] \leftrightarrow N \cdot g[\langle -k \rangle_N]$$

- Parseval

$$\sum_{n=0}^{N-1} |x[n]|^2 = \frac{1}{N} \sum_{k=0}^{N-1} |X[k]|^2$$

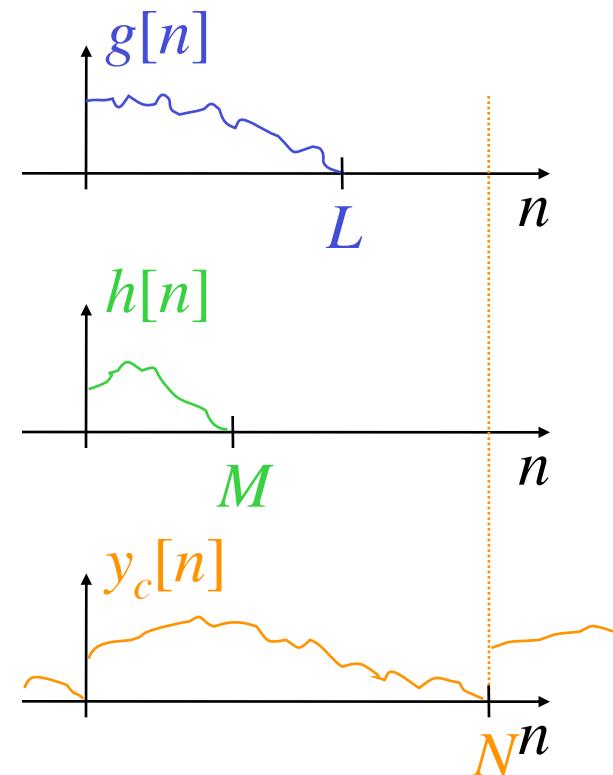

Linear convolution w/ the DFT

- DFT → fast **circular** convolution
- .. but we need **linear** convolution
- Circular conv. is **time-aliased** linear conv.; can aliasing be avoided?
- e.g. convolving L -pt $g[n]$ with M -pt $h[n]$:
 $y[n] = g[n] \circledast h[n]$ has $L+M-1$ nonzero pts
- Set DFT size $N \geq L+M-1 \rightarrow$ **no aliasing**

Linear convolution w/ the DFT

- Procedure ($N = L + M - 1$):
 - pad L -pt $g[n]$ with (at least) $M-1$ zeros
→ N -pt DFT $G[k], k = 0..N-1$
 - pad M -pt $h[n]$ with (at least) $L-1$ zeros
→ N -pt DFT $H[k], k = 0..N-1$
 - $Y[k] = G[k] \cdot H[k], k = 0..N-1$
 - $\text{IDFT}\{Y[k]\} = \sum_{r=-\infty}^{\infty} y_L[n+rN] = y_L[n] \quad (0 \leq n < N)$

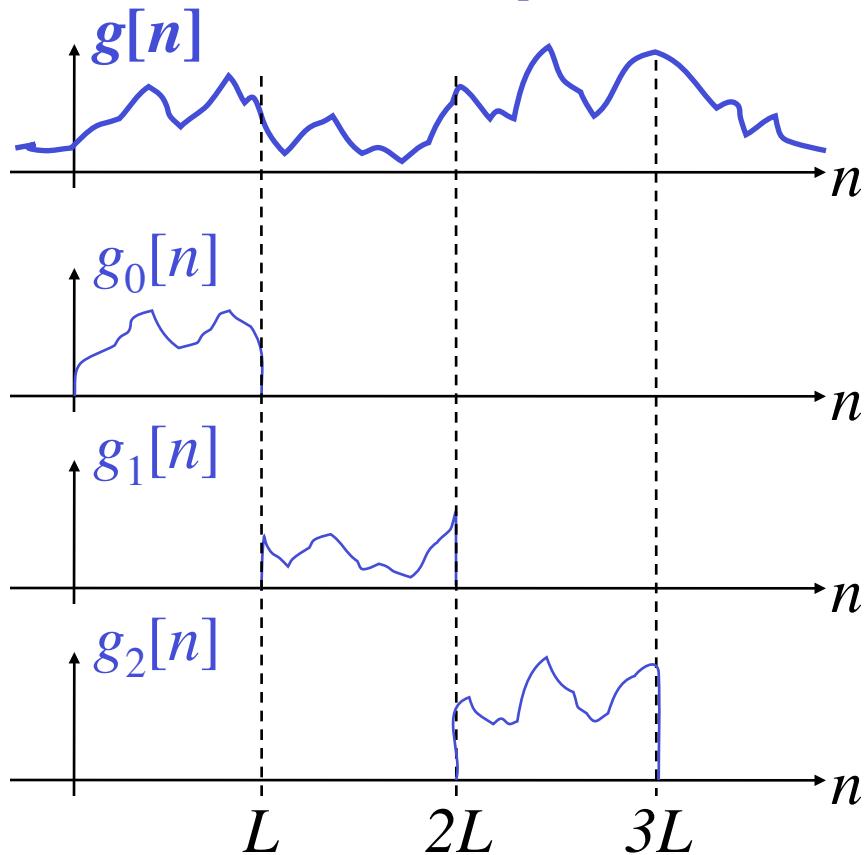

Overlap-Add convolution

- Very long $g[n] \rightarrow$ break up into segments, convolve **piecewise**, overlap
 \rightarrow bound size of DFT, processing delay
- Make $g_i[n] = \begin{cases} g[n] & i \cdot N \leq n < (i + 1) \cdot N \\ 0 & \text{otherwise} \end{cases}$
 $\Rightarrow g[n] = \sum_i g_i[n]$
 $\Rightarrow h[n] \circledast g[n] = \sum_i h[n] \circledast g_i[n]$
- Called Overlap-Add (**OLA**) convolution...

Overlap-Add convolution

$$h[n] \circledast g[n]$$
